Chapter 1

Namespace Index

1.1 Packages

Here are the packages with brief descriptions (if available):

OpenXMLMailMerge	7
OpenXMLMailMerge.Core	8
OpenXMLMailMerge.Core.OpenXMLDocument	8
OpenXMLMailMerge.Core.OpenXMLDocument.Configuration	8
OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary	8
OpenXMLMailMerge.Core.OpenXMLDocument.Document	9
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element	9
OpenXMLMailMerge.Core.OpenXMLDocument.Factory	10
OpenXMLMailMerge.Core.OpenXMLDocument.ML	10

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.Configuration	11
Dictionary< MailMergeDataTypeEnum, Dictionary< string, object >>	
OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.DataDictionary	13
OpenXMLMailMerge.Core.OpenXMLDocument.Factory.DocumentFactory	13
OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler	15
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder	16
OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.GenericConfiguration	19
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ImageElement	20
OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.MailMergeDataTypeEnumExtensions	21
OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument	22
OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML	41
OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.OpenXMLDocumentSettings	27
OpenXMLMailMerge.OXMailMerge	28
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElement	30
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElementConfig	31
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElementConfigExtensions	32
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.RunElement	33
OpenXMLMailMerge.Core.StringConst	34
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TableElement	35
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TableElementConfig	38
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElement	39
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElementConfig	40

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.Configuration	
User defined processor configuration to handle document's field with parameters Example of parameter: field=0=1...	11
OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.DataDictionary	
This class define the document's dictionary. Once the client sets the type of data, the tag and its value, the processor works on these data to merge fields.	13
OpenXMLMailMerge.Core.OpenXMLDocument.Factory.DocumentFactory	
Document processor factory.	13
OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler	
OpenXmlDocument helper to handle the document's content.	15
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder	
Builder to construct the OpenXml elements.	16
OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.GenericConfiguration	
Dynamic configuration set by user.	19
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ImageElement	
Image element class.	20
OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.MailMergeDataTypeEnumExtensions	
Extensions to display the name of the type.	21
OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument	
The OpenXml document processor.	22
OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.OpenXMLDocumentSettings	
OpenXMLDocument definitions.	27
OpenXMLMailMerge.OXMailMerge	
OpenXML MailMerge processor. This class manipulates the OpenXml document in order to process the mail merging.	28
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElement	
Paragraph element class.	30
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElementConfig	
Paragraph element definitions.	31
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElementConfigExtensions	
Extension to get the OpenXml justification enum.	32
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.RunElement	
Run element class.	33
OpenXMLMailMerge.Core.StringConst	
String constant utils.	34
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TableElement	
Table element class.	35

OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TableElementConfig	
Table element definitions class.	38
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElement	
Text element class.	39
OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElementConfig	
Text element definitions.	40
OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML	
A OpenXMLDocument as word processor.	41

Chapter 4

Namespace Documentation

4.1 OpenXMLMailMerge Namespace Reference

Namespaces

- namespace [Core](#)

Classes

- class [OXMailMerge](#)

OpenXML MailMerge processor. This class manipulates the OpenXml document in order to process the mail merging.

Enumerations

- enum [DocumentType](#) { [DocumentType.DOC](#), [DocumentType.XLS](#), [DocumentType.PPT](#) }

Type of document processor

4.1.1 Enumeration Type Documentation

4.1.1.1 enum OpenXMLMailMerge.DocumentType [strong]

Type of document processor

Enumerator

DOC Define a wordprocessor (.DOCX)

XLS Define a spreadsheet processor (.XLSX)

PPT Define a presentation processor (.PPTX)

Definition at line 6 of file [DocumentType.cs](#).

```
00007      {  
00011          DOC,  
00015          XLS,  
00019          PPT  
00020      }
```

4.2 OpenXMLMailMerge.Core Namespace Reference

Namespaces

- namespace [OpenXMLDocument](#)

Classes

- class [StringConst](#)
String constant utils.

4.3 OpenXMLMailMerge.Core.OpenXMLDocument Namespace Reference

Namespaces

- namespace [Configuration](#)
- namespace [Dictionary](#)
- namespace [Document](#)
- namespace [Factory](#)
- namespace [ML](#)

Classes

- class [OpenXMLDocument](#)
The OpenXml document processor.

4.4 OpenXMLMailMerge.Core.OpenXMLDocument.Configuration Namespace Reference

Classes

- class [Configuration](#)
User defined processor configuration to handle document's field with parameters Example of parameter: field=0=1...
- class [GenericConfiguration](#)
Dynamic configuration set by user.

4.5 OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary Namespace Reference

Classes

- class [DataDictionary](#)
This class define the document's dictionary. Once the client sets the type of data, the tag and its value, the processor works on these data to merge fields.
- class [MailMergeDataTypeEnumExtensions](#)
Extensions to display the name of the type.

Enumerations

- enum [MailMergeDataTypeEnum](#) { [MailMergeDataTypeEnum.Regex](#), [MailMergeDataTypeEnum.Image](#), [MailMergeDataTypeEnum.Table](#) }
Type of data to merge fields.

4.5.1 Enumeration Type Documentation

4.5.1.1 enum OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.MailMergeDataTypeEnum [strong]

Type of data to merge fields.

Enumerator

Regex Regex is a single string to be replaced (using regex pattern).

Image Image is a array of byte to include within the document.

Table Table is a System.Data.Table to include within the document.

Definition at line 8 of file [MailMergeDataTypeEnum.cs](#).

```
00009      {  
00013          Regex,  
00017          Image,  
00021          Table  
00022      }
```

4.6 OpenXMLMailMerge.Core.OpenXMLDocument.Document Namespace Reference

Namespaces

- namespace [Element](#)

Classes

- class [DocumentHandler](#)
OpenXmlDocument helper to handle the document's content.

4.7 OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element Namespace Reference

Classes

- class [ElementBuilder](#)
Builder to construct the OpenXml elements.
- class [ImageElement](#)
Image element class.
- class [ParagraphElement](#)
Paragraph element class.
- class [ParagraphElementConfig](#)
Paragraph element definitions.
- class [ParagraphElementConfigExtensions](#)
Extension to get the OpenXml justification enum.
- class [RunElement](#)
Run element class.
- class [TableElement](#)
Table element class.
- class [TableElementConfig](#)

Table element definitions class.

- class [TextElement](#)

Text element class.

- class [TextElementConfig](#)

Text element definitions.

4.8 OpenXMLMailMerge.Core.OpenXMLDocument.Factory Namespace Reference

Classes

- class [DocumentFactory](#)

Document processor factory.

4.9 OpenXMLMailMerge.Core.OpenXMLDocument.ML Namespace Reference

Classes

- class [WordprocessingML](#)

A [OpenXMLDocument](#) as word processor.

Chapter 5

Class Documentation

5.1 OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.Configuration Class Reference

User defined processor configuration to handle document's field with parameters Example of parameter: field=0=1...

Package Functions

- virtual [Configuration GenerateConfiguration](#) (string arg)
Generates configuration based on parameters set in field tag.

Properties

- [GenericConfiguration GenericConfiguration](#) [get, private set]
Generic (dynamic) configuration. Free to be defined.

Private Member Functions

- Dictionary< string, Dictionary< string, object > > [GetParameters](#) (string arg)
Gets the parameters of the text tag by splitting with defined delimiters A parameter should have the format: field=value.

5.1.1 Detailed Description

User defined processor configuration to handle document's field with parameters Example of parameter: field=0=1...
Definition at line 10 of file [Configuration.cs](#).

5.1.2 Member Function Documentation

- 5.1.2.1 virtual [Configuration OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.Configuration.Generate](#)↵
[Configuration](#) (string arg) [package], [virtual]

Generates configuration based on parameters set in field tag.

Parameters

<i>arg</i>	String to be parsed.
------------	----------------------

Returns

A dictionary with parameters and values defined by user.

Definition at line 22 of file [Configuration.cs](#).

```

00023     {
00024         GenericConfiguration.Configuration = new Dictionary<string,
object>();
00025         foreach (var item in GetParameters(arg))
00026         {
00027             GenericConfiguration.Configuration.Add(item.Key, item.
Value);
00028         }
00029
00030         return this;
00031     }

```

5.1.2.2 Dictionary<string, Dictionary<string, object> > OpenXMLMailMerge.Core.OpenXMLDocument.Configuration. Configuration.GetParameters (string arg) [private]

Gets the parameters of the text tag by splitting with defined delimiters A parameter should have the format
: field=value.

Parameters

<i>arg</i>	String to be parsed.
------------	----------------------

Returns

A dictionary with parameters and values.

Definition at line 39 of file [Configuration.cs](#).

```

00040     {
00041         var result = new Dictionary<string, Dictionary<string, object>>();
00042
00043         string key, value;
00044         string masterkey = string.Empty;
00045
00046         foreach (var item in arg.Split(StringConst.ID_DELIMITER_CHAR))
00047         {
00048             if (item.Contains(StringConst.KEY_VALUE_DELIMITER))
00049             {
00050                 var toSplit = item.Split(StringConst.KEY_VALUE_DELIMITER);
00051                 if (toSplit.Length > 0)
00052                 {
00053                     key = toSplit[0];
00054                     value = toSplit[1];
00055                     result[masterkey].Add(key, value);
00056                 }
00057             }
00058             else
00059             {
00060                 masterkey = item.Trim();
00061                 result.Add(masterkey, new Dictionary<string, object>());
00062             }
00063         }
00064
00065         return result;
00066     }

```

5.1.3 Property Documentation

5.1.3.1 GenericConfiguration OpenXMLMailMerge.Core.OpenXMLDocument.Configuration.Configuration.Generic↔ Configuration [get],[private set],[package]

Generic (dynamic) configuration. Free to be defined.

Definition at line 15 of file [Configuration.cs](#).

The documentation for this class was generated from the following file:

- Configuration.cs

5.2 OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.DataDictionary Class Reference

This class define the document's dictionary. Once the client sets the type of data, the tag and its value, the processor works on these data to merge fields.

Inheritance diagram for OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.DataDictionary:

5.2.1 Detailed Description

This class define the document's dictionary. Once the client sets the type of data, the tag and its value, the processor works on these data to merge fields.

Definition at line 10 of file [DataDictionary.cs](#).

The documentation for this class was generated from the following file:

- DataDictionary.cs

5.3 OpenXMLMailMerge.Core.OpenXMLDocument.Factory.DocumentFactory Class Reference

[Document](#) processor factory.

Static Package Functions

- static [OpenXMLDocument CreateDocument](#) ([DocumentType](#) documentType)
Creates a document processor by the document type.

5.3.1 Detailed Description

[Document](#) processor factory.

Definition at line 9 of file [DocumentFactory.cs](#).

5.3.2 Member Function Documentation

5.3.2.1 static `OpenXMLDocument` `OpenXMLMailMerge.Core.OpenXMLDocument.Factory.DocumentFactory.Create`
`Document (DocumentType documentType)` `[static]`, `[package]`

Creates a document processor by the document type.

Parameters

<i>documentType</i>	Type of document processor.
---------------------	-----------------------------

Returns

OpenXmlDocument as document processor.

Definition at line 16 of file [DocumentFactory.cs](#).

```

00017     {
00018         switch (documentType)
00019         {
00020             case DocumentType.DOC:
00021                 return new WordprocessingML();
00022             case DocumentType.XLS:
00023                 throw new NotImplementedException();//return new SpreadsheetML();
00024             case DocumentType.PPT:
00025                 throw new NotImplementedException();//return new PresentationML();
00026             default:
00027                 throw new ArgumentOutOfRangeException("invalid argument");
00028         }
00029     }

```

The documentation for this class was generated from the following file:

- DocumentFactory.cs

5.4 OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler Class Reference

OpenXmlDocument helper to handle the document's content.

Properties

- OpenXmlPackage [Document](#) [get, set]
The OpenXmlPackage itself.
- MainDocumentPart [Content](#) [get, set]
The main document part.
- [ElementBuilder](#) [ElementBuilder](#) [get, set]
The element builder helper.

5.4.1 Detailed Description

OpenXmlDocument helper to handle the document's content.

Definition at line 9 of file [DocumentHandler.cs](#).

5.4.2 Property Documentation

5.4.2.1 MainDocumentPart OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler.Content [get], [set]

The main document part.

Definition at line 18 of file [DocumentHandler.cs](#).

5.4.2.2 `OpenXmlPackage` `OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler.Document` `[get]`, `[set]`

The `OpenXmlPackage` itself.

Definition at line 14 of file [DocumentHandler.cs](#).

5.4.2.3 `ElementBuilder` `OpenXMLMailMerge.Core.OpenXMLDocument.Document.DocumentHandler.ElementBuilder` `[get]`, `[set]`

The element builder helper.

Definition at line 22 of file [DocumentHandler.cs](#).

The documentation for this class was generated from the following file:

- `DocumentHandler.cs`

5.5 `OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder` Class Reference

Builder to construct the `OpenXml` elements.

Public Member Functions

- Text [CreateText](#) (string text)
Creates a Text element.
- Paragraph [CreateParagraph](#) (string text, JustificationValues justificationValue, [TextElementConfig](#) text↔ElementConfig)
Creates a paragraph element.
- Run [CreateRun](#) (string text, [TextElementConfig](#) textElementConfig)
Creates a text with a parent Run element.
- Drawing [CreateImage](#) (byte[] data, `OpenXmlPart` part)
Creates a image (drawing) element.
- Table [CreateTable](#) (int cols, [TableElementConfig](#) tableElementConfig=null)
Creates a table element.
- TableRow [CreateRow](#) ()
Creates a row element.
- TableCell [CreateCell](#) ()
Creates a cell element.
- TableGrid [CreateGrid](#) (int cols=1)
Creates a grid element.

5.5.1 Detailed Description

Builder to construct the `OpenXml` elements.

Definition at line 9 of file [ElementBuilder.cs](#).

5.5.2 Member Function Documentation

5.5.2.1 TableCell OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateCell ()

Creates a cell element.

Returns

OpenXml TableCell element.

Definition at line 79 of file [ElementBuilder.cs](#).

```
00080         {
00081             return TableElement.CreateCell() as TableCell;
00082         }
```

5.5.2.2 TableGrid OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateGrid (int cols = 1)

Creates a grid element.

Parameters

<i>cols</i>	Number of columns.
-------------	--------------------

Returns

OpenXml Grid element.

Definition at line 89 of file [ElementBuilder.cs](#).

```
00090         {
00091             return TableElement.CreateGrid(cols) as TableGrid;
00092         }
```

5.5.2.3 Drawing OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateImage (byte[] data, OpenXmlPart part)

Creates a image (drawing) element.

Parameters

<i>data</i>	Byte array with image data.
<i>part</i>	Parent element.

Returns

OpenXml Drawing (image) element.

Definition at line 50 of file [ElementBuilder.cs](#).

```
00051         {
00052             return ImageElement.CreateImage(data, part) as Drawing;
00053         }
```

5.5.2.4 Paragraph OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateParagraph (string text, JustificationValues justificationValue, TextElementConfig textElementConfig)

Creates a paragraph element.

Parameters

<i>text</i>	Text value.
<i>justificationValue</i>	Justification option.
<i>textElement↔ Config</i>	Text properties definitions.

Returns

OpenXml Text within a Run and Parent element.

Definition at line 28 of file [ElementBuilder.cs](#).

```

00029         {
00030             return ParagraphElement.CreateParagraph(text, justificationValue, textElementConfig) as
Paragraph;
00031         }

```

5.5.2.5 TableRow `OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateRow ()`

Creates a row element.

Returns

OpenXml TableRow element.

Definition at line 70 of file [ElementBuilder.cs](#).

```

00071         {
00072             return TableElement.CreateRow() as TableRow;
00073         }

```

5.5.2.6 Run `OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateRun (string text, TextElementConfig textElementConfig)`

Creates a text with a parent Run element.

Parameters

<i>text</i>	Text value.
<i>textElement↔ Config</i>	Text properties definitions.

Returns

OpenXml Text within a Run element.

Definition at line 39 of file [ElementBuilder.cs](#).

```

00040         {
00041             return RunElement.CreateRunElement(text, textElementConfig) as Run;
00042         }

```

5.5.2.7 Table `OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateTable (int cols, TableElementConfig tableElementConfig = null)`

Creates a table element.

Parameters

<i>cols</i>	Number of columns.
<i>tableElementConfig</i>	Table properties definitions.

Returns

OpenXml Table element.

Definition at line 61 of file [ElementBuilder.cs](#).

```
00062         {
00063             return TableElement.CreateTable(cols, tableElementConfig) as Table;
00064         }
```

5.5.2.8 Text OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ElementBuilder.CreateText (string text)

Creates a Text element.

Parameters

<i>text</i>	Text value.
-------------	-------------

Returns

OpenXml Text element.

Definition at line 16 of file [ElementBuilder.cs](#).

```
00017         {
00018             return TextElement.CreateText(text) as Text;
00019         }
```

- GenericConfiguration.cs

5.7 OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ImageElement Class Reference

Image element class.

Static Package Functions

- static OpenXmlElement [CreateImage](#) (byte[] data, OpenXmlPart documentPart)
Creates a Drawing OpenXml element.

5.7.1 Detailed Description

Image element class.

Definition at line 15 of file [ImageElement.cs](#).

5.7.2 Member Function Documentation

5.7.2.1 static OpenXmlElement OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ImageElement.CreateImage (byte[] data, OpenXmlPart documentPart) [static], [package]

Creates a Drawing OpenXml element.

Parameters

<i>data</i>	Byte array of the image data.
<i>documentPart</i>	Parent element.

Returns

Generic OpenXmlElement.

Definition at line 23 of file [ImageElement.cs](#).

```

5.8 OpenXMLMailMerge.Core.OpenXMLDocument.Dictionary.MailMergeDataTypeEnumExtensions Class Reference

Extensions to display the name of the type.

Static Package Functions

- static string **Description** (this [MailMergeDataTypeEnum](#) mailMergeDataType)

5.8.1 Detailed Description

Extensions to display the name of the type.

Definition at line 27 of file [MailMergeDataTypeEnum.cs](#).

The documentation for this class was generated from the following file:

- MailMergeDataTypeEnum.cs

5.9 OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument Class Reference

The OpenXml document processor.

Inheritance diagram for OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument:

Classes

- class [OpenXMLDocumentSettings](#)
OpenXMLDocument definitions.

Public Member Functions

- void [AddToDictionary](#) ([MailMergeDataTypeEnum](#) dataType, string id, object data)
Adds a data to the dictionary to be merged.
- virtual void [SaveToFile](#) ()
Saves the temporary file.
- virtual void [SaveToFile](#) (string path)
Saves the temporary file.
- virtual void [SaveToFile](#) (string path, Stream stream)
Saves the temporary stream to file.
- virtual [OpenXMLDocument](#) [LoadFromFile](#) (string path, bool isEditable=true, bool removeCopy=false, bool autoSave=false)
Loads a document from file.
- virtual [OpenXMLDocument](#) [LoadFromBytes](#) (byte[] bytes, string tempPath, bool removeCopy=false, bool autoSave=false)
Loads a document from byte array.
- virtual byte[] [GetBytes](#) ()
Gets the document byte array.
- virtual void [Terminate](#) ()
Closes the document and streams.
- virtual void [Process](#) ()
Process the document applying the mail merge.

Properties

- [OpenXMLDocumentSettings](#) [DocumentSettings](#) [get, set]
Document settings.
- [DataDictionary](#) [Dictionary](#) [get, set]
The data dictionary with the merge content and attributes to be processed.
- [DocumentHandler](#) [ContentManager](#) = new [DataDictionary](#)() [get, set]
Manages the document content.

Private Member Functions

- void [Validate](#) ()
Validates the document, content and dictionary.

5.9.1 Detailed Description

The OpenXml document processor.

Definition at line 14 of file [OpenXMLDocument.cs](#).

5.9.2 Member Function Documentation

5.9.2.1 void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.AddToDictionary ([MailMergeDataTypeEnum](#) *dataType*, string *id*, object *data*)

Adds a data to the dictionary to be merged.

Parameters

<i>dataType</i>	The mailmerge data type.
<i>id</i>	The document's field id.
<i>data</i>	Data to replace the field.

Definition at line 56 of file [OpenXMLDocument.cs](#).

```

00057     {
00058         if (!Dictionary.ContainsKey(dataType))
00059         {
00060             var tmpDictionary = new Dictionary<string, object>();
00061             Dictionary.Add(dataType, tmpDictionary);
00062         }
00063         Dictionary[dataType].Add(id, data);
00064     }
00065 }
```

5.9.2.2 virtual byte [] OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.GetBytes () [virtual]

Gets the document byte array.

Returns

Array of byte with document's content.

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 156 of file [OpenXMLDocument.cs](#).

```

00157     {
00158         ContentManager.Document.Close();
00159         return File.ReadAllBytes(DocumentSettings.TempPath).Clone() as byte[];
00160     }
```

5.9.2.3 virtual `OpenXMLDocument` `OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.LoadFromBytes (byte[] bytes, string tempPath, bool removeCopy = false, bool autoSave = false) [virtual]`

Loads a document from byte array.

Parameters

<i>bytes</i>	Array of bytes with file content.
<i>tempPath</i>	Temporary file path.
<i>removeCopy</i>	Whether should remove a copy or not.
<i>autoSave</i>	Whether it should auto save the document.

Returns

[OpenXMLDocument](#) processor.

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 126 of file [OpenXMLDocument.cs](#).

```

00127     {
00128         try
00129         {
00130             if (string.IsNullOrEmpty(tempPath))
00131                 throw new ArgumentNullException("Invalid path");
00132
00133             var fileName = Path.GetFileNameWithoutExtension(tempPath);
00134             var filePath = Path.GetDirectoryName(tempPath);
00135
00136             DocumentSettings = new OpenXMLDocumentSettings()
00137             {
00138                 RemoveFileCopy = removeCopy,
00139                 TempPath = Path.Combine(filePath, fileName + Convert.ToString(new Random().Next()))
00140             };
00141
00142             File.WriteAllBytes(DocumentSettings.TempPath, bytes);
00143
00144             return this;
00145         }
00146         catch (Exception)
00147         {
00148             throw;
00149         }
00150     }

```

5.9.2.4 virtual `OpenXMLDocument` `OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.LoadFromFile (string path, bool isEditable = true, bool removeCopy = false, bool autoSave = false) [virtual]`

Loads a document from file.

Parameters

<i>path</i>	Path of the document.
<i>isEditable</i>	Whether is a editable copy.
<i>removeCopy</i>	Whether should remove a copy or not.
<i>autoSave</i>	Whether it should auto save the document.

Returns

[OpenXMLDocument](#) processor.

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 102 of file [OpenXMLDocument.cs](#).

```

00103     {
00104         var fileName = Path.GetFileNameWithoutExtension(path);
00105         var filePath = Path.GetDirectoryName(path);

```

```

00106
00107         DocumentSettings = new OpenXMLDocumentSettings()
00108     {
00109         RemoveFileCopy = removeCopy,
00110         TempPath = Path.Combine(filePath, fileName + Convert.ToString(new Random().Next()))
00111     };
00112     File.Copy(path, DocumentSettings.TempPath);
00113
00114     return this;
00115 }
00116

```

5.9.2.5 virtual void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.Process () [virtual]

Process the document applying the mail merge.

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 203 of file [OpenXMLDocument.cs](#).

```

00204     {
00205         try
00206         {

00208         }
00209         catch (Exception)
00210         {
00211             throw;
00212         }
00213     }

```

5.9.2.6 virtual void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.SaveToFile () [virtual]

Saves the temporary file.

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 70 of file [OpenXMLDocument.cs](#).

```

00071     {
00072         throw new InvalidOperationException("Invalid call");
00073     }

```

5.9.2.7 virtual void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.SaveToFile (string path) [virtual]

Saves the temporary file.

Parameters

<i>path</i>	Path to save.
-------------	---------------

Reimplemented in [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).

Definition at line 79 of file [OpenXMLDocument.cs](#).

```

00080     {
00081         throw new NotImplementedException();
00082     }

```

5.9.2.8 virtual void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.SaveToFile (string path, Stream stream) [virtual]

Saves the temporary stream to file.

Parameters

<i>path</i>	Path to save.
<i>stream</i>	Document's data stream.

Definition at line 89 of file [OpenXMLDocument.cs](#).

```
00090     {
00091         throw new NotImplementedException();
00092     }
```

5.9.2.9 virtual void OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument.Terminate () [virtual]

Closes the document and streams.

Definition at line 180 of file [OpenXMLDocument.cs](#).

```
00181     {

5.11 OpenXMLMailMerge.OXMailMerge Class Reference

OpenXML MailMerge processor. This class manipulates the OpenXml document in order to process the mail merging.

Public Member Functions

- [OXMailMerge](#) ()
Default constructor.
- [OXMailMerge](#) ([DocumentType](#) documentType)
Creates a [OpenXMLMailMerge](#) instance with a specific document processor.
- [OXMailMerge](#) ([OpenXMLDocument](#) externalDocumentProcessor)
Creates a [OpenXMLMailMerge](#) instance with a external document processor.
- [OpenXMLDocument CreateDocument](#) ([DocumentType](#) documentType)
Creates a document by type.
- void [Terminate](#) ()
Sets the process to end and close all streams.
- void [Process](#) ()
Process a document and executes the mail merging activity.

Properties

- [OpenXMLDocument Document](#) [get, set]
Document processor handler.

5.11.1 Detailed Description

OpenXML MailMerge processor. This class manipulates the OpenXml document in order to process the mail merging.

Definition at line 11 of file [OXMailMerge.cs](#).

5.11.2 Constructor & Destructor Documentation

5.11.2.1 OpenXMLMailMerge.OXMailMerge.OXMailMerge ()

Default constructor.

Definition at line 21 of file [OXMailMerge.cs](#).

```
00021 { }
```

5.11.2.2 OpenXMLMailMerge.OXMailMerge.OXMailMerge ([DocumentType](#) documentType)

Creates a [OpenXMLMailMerge](#) instance with a specific document processor.

Parameters

<i>documentType</i>	Type of document processor.
---------------------	-----------------------------

Definition at line 27 of file [OXMailMerge.cs](#).

```
00028         {
00029             CreateDocument (documentType);
00030         }
```

5.11.2.3 OpenXMLMailMerge.OXMailMerge.OXMailMerge (OpenXMLDocument externalDocumentProcessor)

Creates a [OpenXMLMailMerge](#) instance with a external document processor.

Parameters

<i>externalDocumentProcessor</i>	External OpenXMLDocument processor.
----------------------------------	-------------------------------------

Definition at line 36 of file [OXMailMerge.cs](#).

```
00037         {
00038             Document = externalDocumentProcessor;
00039         }
```

5.11.3 Member Function Documentation**5.11.3.1 OpenXMLDocument OpenXMLMailMerge.OXMailMerge.CreateDocument (DocumentType documentType)**

Creates a document by type.

Parameters

<i>documentType</i>	Type of document processor.
---------------------	-----------------------------

Returns

OpenXMLDocument processor.

Definition at line 46 of file [OXMailMerge.cs](#).

```
00047         {
00048             Document = DocumentFactory.CreateDocument (documentType);
00049             return Document;
00050         }
```

5.11.3.2 void OpenXMLMailMerge.OXMailMerge.Process ()

Process a document and executes the mail merging activity.

Definition at line 71 of file [OXMailMerge.cs](#).

```
00072         {
00073             Document.Process ();
00074         }
```

5.11.3.3 void OpenXMLMailMerge.OXMailMerge.Terminate ()

Sets the process to end and close all streams.

Definition at line 55 of file [OXMailMerge.cs](#).

```

00056         {
00057             try
00058             {
00059                 Document.Terminate();
00060             }
00061             catch (Exception)
00062             {
00063             }
00064             throw;
00065         }
00066     }

```

5.11.4 Property Documentation

5.11.4.1 OpenXMLDocument OpenXMLMailMerge.OXMailMerge.Document [get], [set]

Document processor handler.

Definition at line 16 of file [OXMailMerge.cs](#).

The documentation for this class was generated from the following file:

- [OXMailMerge.cs](#)

5.12 OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.Paragraph↔ Element Class Reference

Paragraph element class.

Static Package Functions

- static OpenXmlElement [CreateParagraphProperties](#) (ParagraphElementConfig paragraphElement↔ Config=null)
Creates the OpenXml ParagraphProperties.
- static OpenXmlElement [CreateParagraph](#) (string text=null, JustificationValues justificationValue=Justification↔ Values.Left, TextElementConfig textElementConfig=null)
Creates a Paragraph OpenXmlElement.

5.12.1 Detailed Description

Paragraph element class.

Definition at line 9 of file [ParagraphElement.cs](#).

5.12.2 Member Function Documentation

5.12.2.1 static OpenXmlElement OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElement.Create↔ Paragraph (string text = null, JustificationValues justificationValue = JustificationValues.Left, TextElementConfig textElementConfig = null) [static], [package]

Creates a Paragraph OpenXmlElement.

Parameters

<i>text</i>	Text value.
<i>justificationValue</i>	Justification option.
<i>textElement↵ Config</i>	Text properties definitions.

Returns

Definition at line 31 of file [ParagraphElement.cs](#).

```
00032     {
00033         var paragraphConfig = new ParagraphElementConfig() { Justification = justificationValue };
00034         var paragraphProperties = CreateParagraphProperties(paragraphConfig);
00035         var result = new Paragraph() { ParagraphProperties = paragraphProperties as ParagraphProperties
};
00036
00037         if (text != null)
00038         {
00039             if (textElementConfig == null)
00040                 textElementConfig = new TextElementConfig();
00041
00042             var runProperties = RunElement.CreateRunProperties(textElementConfig);
00043             var textElement = RunElement.CreateRunElement(text, textElementConfig);
00044             result.Append(textElement);
00045         }
00046
00047         return result;
00048     }
```

5.12.2.2 `static OpenXmlElement OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.ParagraphElement.↵
CreateParagraphProperties (ParagraphElementConfig paragraphElementConfig = null) [static],
[package]`

Creates the OpenXml ParagraphProperties.

Parameters

<i>paragraph↵ ElementConfig</i>	Paragraph definitions.
-------------------------------------	------------------------

Returns

Paragraph OpenXmlElement.

Definition at line 16 of file [ParagraphElement.cs](#).

```
00017     {
00018         if (paragraphElementConfig == null)

5.19 OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElement Class Reference

Text element class.

Static Package Functions

- static OpenXmlElement [CreateText](#) (string text)
Creates a text element.

5.19.1 Detailed Description

Text element class.

Definition at line 10 of file [TextElement.cs](#).

5.19.2 Member Function Documentation

5.19.2.1 **static OpenXmlElement** OpenXMLMailMerge.Core.OpenXMLDocument.Document.Element.TextElement.CreateText (string text) [static], [package]

Creates a text element.

Parameters

<i>text</i>	Text value.
-------------	-------------

Returns

Text OpenXmlElement.

Definition at line 17 of file [TextElement.cs](#).

```
00018     {
00019         if (text != null)
00020             return new Text() { Text = text };
00021

5.21 OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML Class Reference

A [OpenXMLDocument](#) as word processor.

Inheritance diagram for OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML:

Public Member Functions

- override [OpenXMLDocument LoadFromFile](#) (string path, bool isEditable=true, bool removeCopy=false, bool autoSave=false)
Loads a document from file.
- virtual byte[] [TryReplaceImage](#) (string arg)
Gets the value from the data dictionary entry.
- virtual DataTable [TryReplaceTable](#) (string arg)
Gets the value from the data dictionary entry.
- override void [Process](#) ()
Process the document applying the mail merge.
- override void [SaveToFile](#) ()
Saves the temporary file.
- override [OpenXMLDocument LoadFromBytes](#) (byte[] bytes, string tempPath, bool removeCopy=false, bool autoSave=false)
Loads a document from byte array.
- override void [SaveToFile](#) (string path)
Saves the temporary file.
- override byte[] [GetBytes](#) ()
Gets the document byte array.

Protected Member Functions

- virtual string [TryReplaceString](#) (string arg)
Gets the value from the data dictionary entry.
- virtual void [ProcessRegex](#) ()
Executes string regex replacement.
- virtual void [ProcessImage](#) ()

Executes image replacement.

- virtual void [ProcessTable](#) ()

Executes table replacement.

Private Member Functions

- void [Save](#) ()

Saves the temporary file.

Additional Inherited Members

5.21.1 Detailed Description

A [OpenXMLDocument](#) as word processor.

Definition at line 16 of file [WordprocessingML.cs](#).

5.21.2 Member Function Documentation

5.21.2.1 override byte [] [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML.GetBytes](#) () [virtual]

Gets the document byte array.

Returns

Array of byte with document's content.

Reimplemented from [OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument](#).

Definition at line 442 of file [WordprocessingML.cs](#).

```

00443     {
00444         var bytes = base.GetBytes();
00445
00446         //This override was made because it was easier to copy the closed actual saved file rather than
         gets its memory copy
00447
00448         ContentManager = new DocumentHandler()
00449         {
00450             Document = WordprocessingDocument.Open(DocumentSettings.
TempPath, true, new OpenSettings() { AutoSave = DocumentSettings.
AutoSave })
00451         };
00452
00453         ContentManager.Content = (ContentManager.
Document as WordprocessingDocument).MainDocumentPart;
00454
00455         return bytes;
00456     }

```

5.21.2.2 override [OpenXMLDocument](#) [OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML](#).↵ [LoadFromBytes](#) (byte[] bytes, string tempPath, bool removeCopy = false, bool autoSave = false) [virtual]

Loads a document from byte array.

Parameters

<i>bytes</i>	Array of bytes with file content.
<i>tempPath</i>	Temporary file path.
<i>removeCopy</i>	Whether should remove a copy or not.
<i>autoSave</i>	Whether it should auto save the document.

Returns

[OpenXMLDocument](#) processor.

Reimplemented from [OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument](#).

Definition at line 401 of file [WordprocessingML.cs](#).

```

00402     {
00403         base.LoadFromBytes(bytes, tempPath, removeCopy, autoSave);
00404
00405         DocumentSettings.AutoSave = autoSave;
00406
00407         ContentManager = new DocumentHandler()
00408         {
00409             Document = WordprocessingDocument.Open(DocumentSettings.
TempPath, true, new OpenSettings() { AutoSave = DocumentSettings.
AutoSave })
00410         };
00411
00412         ContentManager.Content = (ContentManager.
Document as WordprocessingDocument).MainDocumentPart;
00413
00414         return this;
00415     }

```

5.21.2.3 override OpenXMLDocument OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML.LoadFromFile (string path, bool isEditable = true, bool removeCopy = false, bool autoSave = false) [virtual]

Loads a document from file.

Parameters

<i>path</i>	Path of the document.
<i>isEditable</i>	Whether is a editable copy.
<i>removeCopy</i>	Whether should remove a copy or not.
<i>autoSave</i>	Whether it should auto save the document.

Returns

[OpenXMLDocument](#) processor.

Reimplemented from [OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument](#).

Definition at line 26 of file [WordprocessingML.cs](#).

```

00027     {
00028         base.LoadFromFile(path, isEditable, removeCopy);
00029
00030         DocumentSettings.AutoSave = autoSave;
00031
00032         ContentManager = new DocumentHandler()
00033         {
00034             Document = WordprocessingDocument.Open(DocumentSettings.
TempPath, isEditable, new OpenSettings() { AutoSave = DocumentSettings.
AutoSave })
00035         };
00036
00037         ContentManager.Content = (ContentManager.
Document as WordprocessingDocument).MainDocumentPart;
00038
00039         return this;
00040     }

```

5.21.2.4 override void OpenXMLMailMerge.Core.OpenXMLDocument.ML.WordprocessingML.Process () [virtual]

Process the document applying the mail merge.

Reimplemented from [OpenXMLMailMerge.Core.OpenXMLDocument.OpenXMLDocument](#).

Definition at line 348 of file [WordprocessingML.cs](#).

```

00349     {
00350         base.Process();
00351
